Tech Note for InterPlot Organizer Version 08.05.00.34

Details:
- Resource files are not plotting correct via organizer

Problem:
- InterPlot has problems using a MS workspace that has a space in the name, example: "KYTC Roadway". MicroStation will read the workspace OK and IPLOT Dialog will work OK. There are problems when using the IPLOT Command Line and in Organizer.

Work around:
- You will need to open the Properties for each file. You cannot group all of your design files together and open the properties.
- Under the General tab you will need to add ""'s around the User Workspace as well as the Project Workspace if there are spaces in the name of either one of them, for example: "KYTC Roadway" See Figure 1below.

Figure 1

Tech Note for MicroStation Design File History

Problem:
- Design File History not working in KYTC Standards Version 2.00.

Fix:
- You will need to first verify that you have version 2.01 or greater installed. This can be found in MicroStation under the Help > KYTC Version.
- You will need to close all MicroStation sections and delete the User Preferences file. This file is found in the Bentley folder, example: "C:\Program Files\Bentley\Home\Prefs\SClause.UPF". Please see Figure 2 below.
- MicroStation will recreate this file the next time it is started.
- When you delete this file, you will be loosing your preferences. These are things like, the size of the MicroStation window upon startup and its location, button assignments, what tool pallets you have open and their docket location, etc.
